

MOUNT SALOMONE - AN ASTRONOMICALLY ORIENTED PEAK, MAYBE IN RELATION TO PRE- ROMAN CULTURES

ABSTRACT

In this study, astronomical and geographic data relating to Mount Solomon were considered, a hill of volcanic origin on the top of which an oblong depression and two vaginal-shaped walls (perhaps formerly fortified) were built and astronomically oriented with the dawn of the summer solstice. Can this height provide important information for the rediscovery of Italy's distant historical past? It is the

same culture present in the center of the Italian Apennines (Italic peoples of ancient Roman times), or it is a culture linked to the ancient cult of the "Mother Goddess", whose traces are lost in our distant past, thousands of years ago?

Keywords: Astronomical alignment, Italy, Mount Salomone, Ancient Italic vestiges, Ancient history.

1.0 – INTRODUCTION

The study of our distant Italic past turns out to be extremely difficult if we consider that there is not much evidence that the ancient peoples have left us, especially the written ones. The only existing traces are almost all of "lithic" origin, or linked to constructs that have come down to our age. Official history tells us that before 2,000 BC there were no advanced peoples in central Italy [1]. However, the indications that are reported to us precisely by these testimonies can lead to hypotheses that are much more backdated in time and belong to the ancient cult of the Mother Goddess [4] [5]. In this case we must speak of prehistoric or protohistoric events [2] since the events that speak for

the first time of this Italic cult are to be referred to precisely that epoch.

I explored Mount Salomone on March 16, 2014, together with researcher and friend Riccardo Bellucci. Until then, this hill, located near Mount Tusculum, on the north (external) wall of the Latium Volcano, was a simple hill with a summit characterized by a concave depression, which was cut on the highest part of the hill. It was characterized by two walls dug into the ground, which gave it a particularly tapered and clearly anthropogenic appearance..

2.0 DATA ANALYSIS

The data acquired in this study were all obtained by means of excursions carried out starting from 2014. We walk along a path, slightly uphill, on the morning of March 16, 2014, at the summit of Mount Salomone, a summit that I immediately understood to have a "vaginal" shape: [3] Monte Salomone, a place that in ancient times must surely have been a focal point, probably the seat of some kind of ancient village, a

place probably sacred and linked to certain ancestral cults linked to the Goddess Mandre, since the form *dle'*altura, just like the vaginal orifice, was intended to refer in all probability to the ancient Italic cults linked to women [3]. On the hill I carried out geomagnetic surveys, attesting a field intensity of around 56 μ Tesla. An intensity that cannot be underestimated, the

average of the area was in fact between 38 and 39 μ Tesla!

Fig. 1 – Three-dimensional model of the hill of Mount Salomone, in which the two walls, created by digging the ground, can be observed very well. In this case, the anthropic origin of the structure is clear. Credits: Google Earth.

This electromagnetic level showed us that those who had built it from the top in ancient times, modeling it, did it not by chance, also considering the energy of the place?

There are many hypotheses in this research context, but unfortunately there is no evidence that ancient populations could measure the intensity of the earth's

geomagnetic field, at least not with the techniques known today.

The rise indicated that the people who had built it must have profound engineering as well as astronomical knowledge since the vaginal depression was astronomically oriented towards the dawn of the summer solstice. The analyzes were carried out thanks

to the use of Google Earth Pro and the astronomical software Stellarium, with which the actual presence of

the Sun was calculated, along the azimuth indicated by the pointed top.

But the important revelations of Mount Solomon did not end there. In 2015, within my personal research project focused on the astronomical study of hilly areas of pre-Roman origin, I was able to clearly observe an astronomical orientation of the summit of Mount Solomon, an orientation that was similar to that of

many other modeled hills. from the hand of man, shaped in times when according to official science, there could not have been civilizations with astronomical knowledge of this type, and not before the ancient Roman era (Italic peoples of central Italy).

As can be seen from the reconstruction carried out using Google Earth, when the Sun rises during the Summer Solstice (June 23), the longitudinal axis of the concave summit of Mount Solomon is perfectly oriented with our star! This shows us how, probably there must have been a cult linked to the Sun but also

to the Mother Goddess [5], as the top of the mountain was characterized not only by a vaginal-shaped depression, but above all by two concentric belts that had to symbolize the small and the labia majora of the female genital organ, now partly incorporated in the vegetation. All this was very obvious.

3.0 CONCLUSIONS

In conclusion to this study, it can undoubtedly be confirmed that Mount Solomon has a summit characterized by a vaginal-shaped depression, equipped with two external girdles, similar to the female genital organ, and therefore probably linked to the very ancient cult of the Mother Goddess and of the Solar Cult, of pre-Roman origin.

Another important fact is the astronomical orientation of this summit, towards the dawn of the Summer Solstice (23 June). This indicates unequivocally that whoever built and modeled the summit of Mount Solomon did it for astronomical purposes, related to the calculation of time. It cannot therefore be a question of peoples without culture, but of an extremely advanced civilization. In fact, in pre-historic times the symbol of the "fish" and the ellipse was linked to the uterus of the Mother Goddess [1] [4] [5].

We know that the fortifications built throughout the Central Apennines originated from the ancient Italic peoples, in part these peoples came into contact with the Roman civilization and with the supremacy of its empire, but we know little or nothing of their real origin [6]. Examples of fortifications built on the top of the Apennines, were also astronomically oriented, even part of these fortifications turned out to be astronomically oriented with important astronomical elements, even if we do not know if these orientations were to be considered older works of the populations who then fortified these hills, for war purposes.

It is, in my humble opinion, important to further investigate the origin of this summit, precisely because of the characteristics it retains and which has witnessed for millennia.
